Usage Warnings

- 1) High voltage transients, surges, and other power irregularities can cause extensive damage. It is the user's responsibility to provide a power protection system.
- 2) It is the user's responsibility to install, operate, and maintain the system in accordance with all applicable codes, regulations, and safety measures.

Trademark and Patents

All trademarks, patents and copyrights apply.

Without prior notice and without obligation, the contents of this manual may be revised to incorporate changes and improvements. Every effort has been made to ensure that the information is complete and accurate at the time of publication. Nevertheless, Eurotech Communication cannot be held responsible for errors or commissions.

Dear Customer,

We thank you for purchasing our GSM Multi Cell to ISDN PRI Gateways.

The information in this manual does not constitute a warranty of performance, although the information has been compiled and checked for accuracy by Eurotech Communication Ltd.

All our products are developed and produced by experienced engineers, who aspire to achieve customer satisfaction, utility value and reliability of products.

Warranty Policy

The PRI Multi Cell ISDN GSM Gateway product you have purchased is under warranty for 1 year from the date of purchase, by the original purchaser. In case of defects of materials or workmanship, Eurotech Communication will replace it free of charge. This warranty applies to hardware/software but does not include SIM Cards.

This warranty will not be honored if the device has been mishandled in any way.

We hope you enjoy our product and we will be happy to receive any comments you may have. This will enable us to improve our products and the Technical Support that we give to every customer.

Getting Started

Eurotech Communication team is glad you have chosen to use the Eurotech's Multi-Cell PR gateway for your needs, we will do our best to make your installation efforts as well as day-to-day configuration and monitoring tasks be pleasant tasks as possible. We wish you a smooth operation while greatly saving your office mobile phone calls.

This chapter is your Map for installation, configuration and monitoring tasks and includes a short explanation on each stage as well as references for more elaborated explanations, drawings and examples in other chapters. The following is a list of tasks you shall perform, where you shall go over it sequentially or skip tasks that are optional and not required for your current needs. It is advised that you will use the following tasks as your Do To List. Make a print of this chapter and put notes on each stage when completed (e.g. V mark when done).

- Mandatory - Check that all Package items are included

Refer to "Check your Package Items" chapter for checking that all items that should be in your package.

- Mandatory – Install The Management Application

On the PC / Laptop allocated for the system management install the MS-Windows Management Application with the provided CD.

Refer to "Chapter 2: Installing the Manager Application" chapter for all items that should be in your package.

- Mandatory connections
 - Install Power Cable
 - Install Ground Cable
 - Install Antennas
 - Install ISDN cable
 - Install RS-232 (Comport cable) serial or RJ-45 Ethernet cable

Refer to "Chapter 1: Connecting the Cables" for specific and detailed guidelines.

- Mandatory – General configurations

In order to operate the system a mandatory basic setups should be performed in one of the two optional connections, serial RS-232 or via Internet. The 1'st time configuration is recommended to be performed via RS-232 while later on configuration, monitoring and reports is recommended to be performed via IP.

Refer to "Chapter 3: Basic configurations with the management application".

- Mandatory - 1'st time system configuration via RS-232

Use the RS-232 connection and PRI Management MS-Windows application as your 1'st time configuration. You can use this method for later day-to-day management, however the option to manage your PRI – GSM Gateway system via IP is highly recommended as you can have the management done remotely from the system via internet connection.

Refer to "Chapter 3.1: Management via RS-232" chapter.

"Chapter 3: Basic configurations with the management application" and

- Optional - Setting the TCP/IP connections

If you wish to operate the management application for system management via internet connection the proper TCP/IP settings should be performed.

Refer to "Chapter 10: TCP/IP Setting".

- Optional – Managing the system via IP connection

In order to manage, configure and monitor the system via IP the system TCP/IP connections, the Ethernet cables and the PRI Management MS-Windows application should be properly installed and configured.

Refer to "**Chapter 3.2: Management via Internet connection**".

- Optional Task- Configurations

In order to operate the system ports and use the installed SIM cards a certain setups should be performed. Refer to the following chapter that match your configuration needs:

Chapter 3.2: Management via Internet connection

Chapter 4: Configuration - Defining Groups of Ports

Chapter 5: Configuration - Port and SIM

Chapter 5.1 Configuration - SIM Card Settings

Chapter 6: Configuration - ISDN Connection Settings

Chapter 6.1: Configuration - ISDN B-Channel-Port Association

- Optional Task- Monitoring calls

The PRI Management MS-Windows application enables you to monitor calls in real time. It is recommended that the management application PC will be connected via IP to enable flexible and continues connection with the monitored system.

Refer to "Chapter 8: Monitoring Calls"

- Optional Task- Making usage reports

The PRI Management MS-Windows application enables you to generate call reports and export the report files for additional analysis. It is recommended that the management application PC will be connected via IP to enable flexible and continues connection with the monitored system.

Refer to "Chapter 9: Generating Call Reports"

- Optional – Test call Office phone to GSM Cellphone

Make a test voice call, from your office phone to a GSM Cellphone.

This will enable you to trace problems in your settings and will guide you to trace the root cause of your operational error if any, to overcome operational problems. If still after all the guidelines and sub tests completed and you could not still trace the problem, you are referred to "Chapter 12: Troubleshooting and known issues".

Refer to "**Chapter 11: Operational test**".

- Known issues and Troubleshooting

If you had problem in setting up the system or completed the setups according to this manual and still there are operational problems refer to the proper chapter of known issues and troubleshooting.

Refer to "Chapter 12: Troubleshooting and known issues".

For getting the most updated Product Info on the Web

Refer to <http://www.eurotech-communication.com>

At menu: **Cellular Gateways**

At sub menu: **PRI E1/T1 GSM or CDMA (note: CDMA capabilities not supported in your package)**

Having Your feedback

Please let us know your feedback and enhancement ideas to improve the product to your best value.

Email: Support@Eurotech-Communication.com

Check your package Items

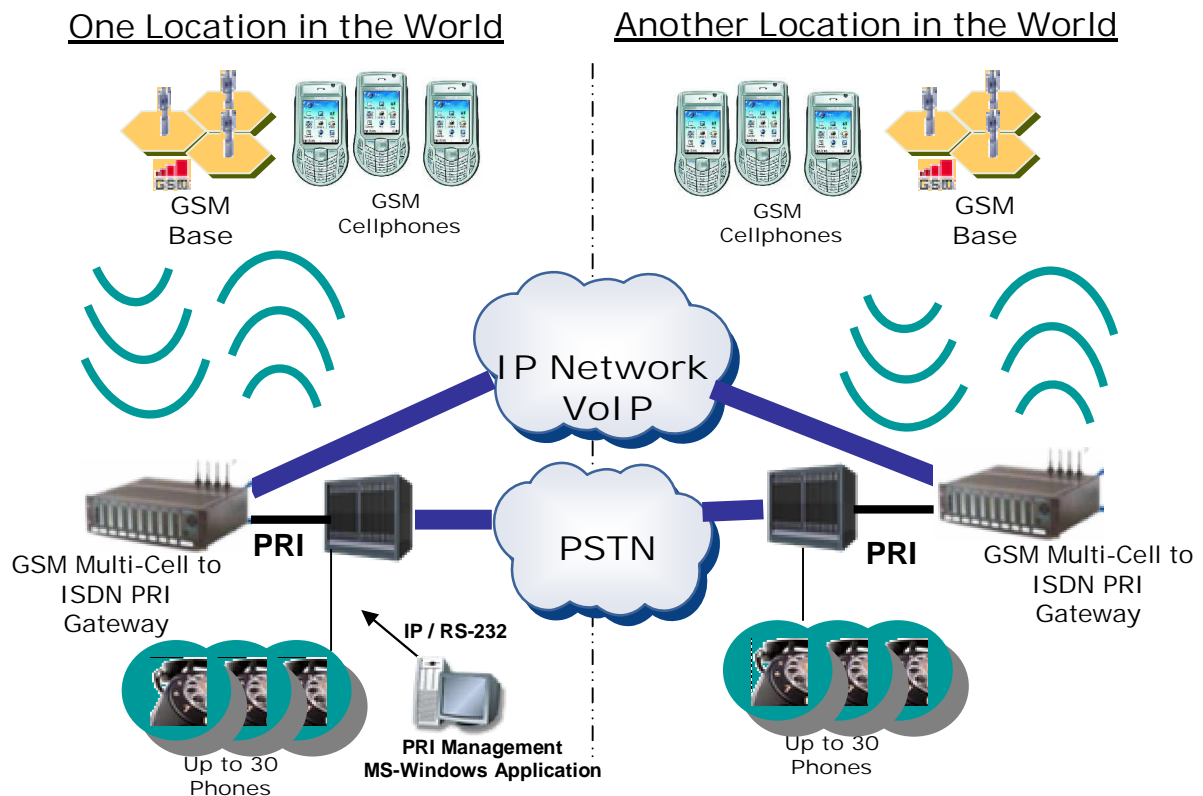

Please verify your package contains the following components (some were ordered specific) before installation:

- Main Hardware Device - The Multi-Cell PRI Gateway
- 110/220V Power supply cable
- Software Installation CD - Installation kit of the PRI Management MS-Windows Application, this User Manual file and additional auxiliary utilities.
- 4 or 8 GSM Antennas - Small/Large sized, based on your specific order
- RJ-11 Phone handset - for testing voice calls from different ports
- RJ-45 - RS-232 Serial connection cable we'll be referred as Comport cable in this manual
- 4 additional cables as follows
 - RJ-45 ISDN E1 cross connect cable
For direct ISDN E1 connection without intermediate PBX
 - RJ-45 ISDN E1 regular connection cable
For ISDN E1 connection to a PBX
 - RJ-45 Ethernet cross connect cable
For direct IP connection to a PC 1'st time
 - RJ-45 Ethernet regular connection cable
For IP connection to a PC via IP routing and switching equipmenet

Note: The ground cable is not supplied as it is very common, low cost and various types apply.

The ISDN PRI GSM Gateway Solution Overview

The Multi-Cell ISDN PRI to GSM gateway is a device that connects your office phones DIRECTLY to GSM cellular phone networks. This gateway completely bypasses the local landline telephone company. 30 office phones can be connected to each Multi-Cell Gateway and operate simultaneously. Each port (phone connection) in the "Multi-Cell" gateway can hold four Cellphone SIM cards. You can configure each port so that the most economical SIM is active at given time and call scenario.

An MS-Windows PC/Laptop can be used to operate the PRI Management MS-Windows application. The PRI Management MS-Windows application is used for configuration, monitoring and usage reports generation, via RS-232 (Comport) or IP connection.

The Management Application provided is mandatory for configuring the GSM Multi-Cell PRI gateway operation and optional for monitoring and reports. However it is highly recommended to leave the Management Application always on via an Internet connection for monitoring, reporting and performing configuration changes anytime.

The PRI Management MS-Windows application provides the following functionalities:

- Configuration - Connections, ports, channels, SIM cards and operational modes can be configured
- Monitoring - Call operations can be monitored from the Management Application. Therefore you may wish to leave a computer permanently connected to the Multi-Cell PRI system all time.
- Reports and statistics - Calls report, calls history, antenna reception, status logs and more, can be generated for analysis in standard MS-Windows data processing tools such as MS-ACCESS and MS-EXCEL.

Chapter 1: Connecting the Cables

You have several cables to connect to the Multi-Cell PRI Gateway. Some are mandatory and some are optional based on the specific use case.

Basic Connections

- Power Cable 110/220V - The power cable is supplied and should cover all main voltage electricity services in the world. However you should check the plug supplied with the socket where you installing the system. Connect a 120 V (North America), or 240 V (Europe) power supply cable to the Multi-Cell gateway.
- Ground cable - The ground cable is not supplied and can be any ground cable that can be available in Electricity shop and best suite for your ground socket available. Connect the ground wire to a suitable ground socket or connection available.
- ISDN cable - The regular ISDN cable is used to connect the system to the PBX, serving the Office landline phones.
For the regular ISDN cable, connect the ISDN line from the telephone switching unit in your office to the Multi-Cell unit. Connect the ISDN line to the socket labeled "ISDN" in the front of the Multi-Cell unit, as shown below.
- Comports cable - The RS-232 to Ethernet serial connection cable between Management Application PC via RS-232 serial COM port and RJ-45 on the Multi-Cell PRI Gateway system. This connection is used for the recommended 1st time setting.
- RJ-45 Ethernet cable - The regular RJ45 Ethernet cable to be connected between PC with the Multi-Cell PRI Gateway Management application and the Multi-Cell PRI gateway system (Cable side labeled "NET"), via a routing and switching fabric. This is the additional option to connect the management application PC to the system and has the benefit of enabling operating management of configuration, monitoring and reporting from any location where the Multi-Cell PRI gateway system IP is known.

RJ-45 Ethernet cable
(Optional for IP based Management Application connection).

Comport cable from auxiliary computer

An ISDN Telephone line

After you have connected the cables properly, turn on the Multi-Cell PRI Gateway

and make the proper configuration according to your needs following the Management Application guidelines in the following chapters.

Additional cables used as follows:

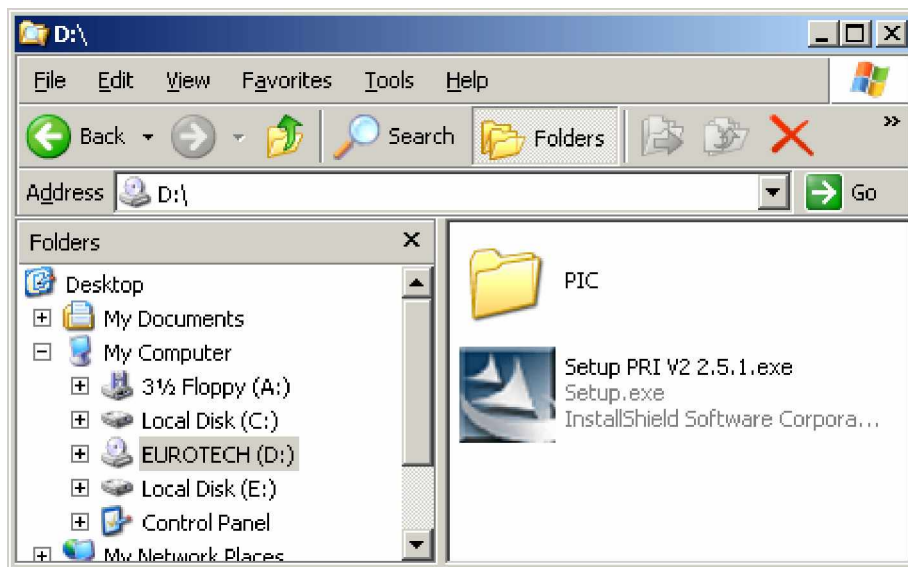

- RJ-45 ISDN E1 Cross connect cable
Used in the same case as the regular ISDN E1 cable depending on the ISDN settings.
- RJ-45 Ethernet cross connect cable
For direct IP connection to a PC in-order to set the initial IP settings of the Multi-Cell Gateway system.

Chapter 2: Installing the Manager Application

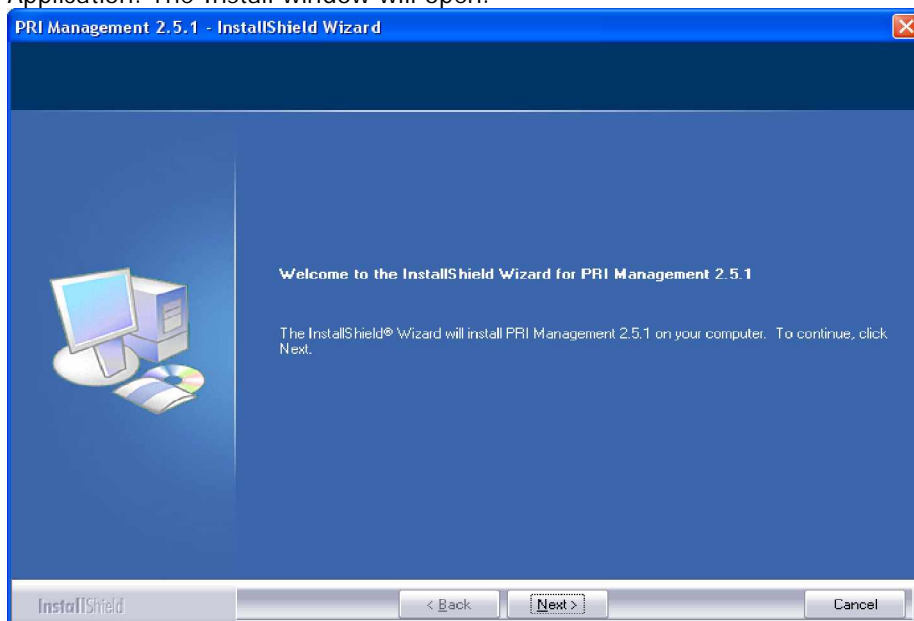

Before operation, configuration settings must be made to the gateway. Configuration is done in an auxiliary computer with the PRI Management MS-Windows Application provided for MS-Windows operating system.

Install the Multi-Cell Manager Application into an MS-Windows PC

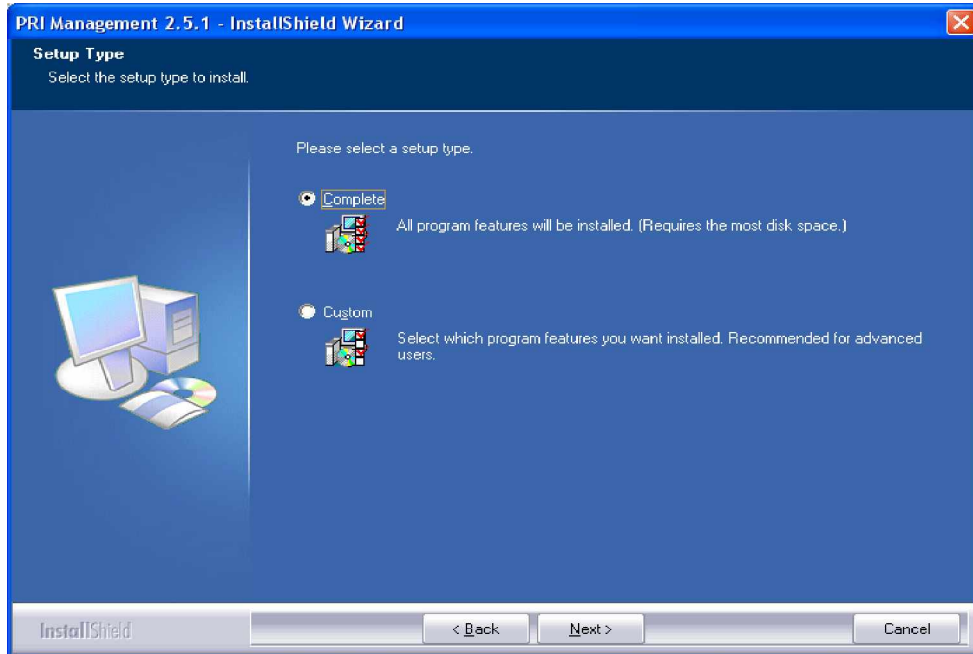

1. Insert the Multi-Cell compact disk into the CD drive of the configuration computer.
2. In Windows Explorer, navigate to in the installation CD drive.

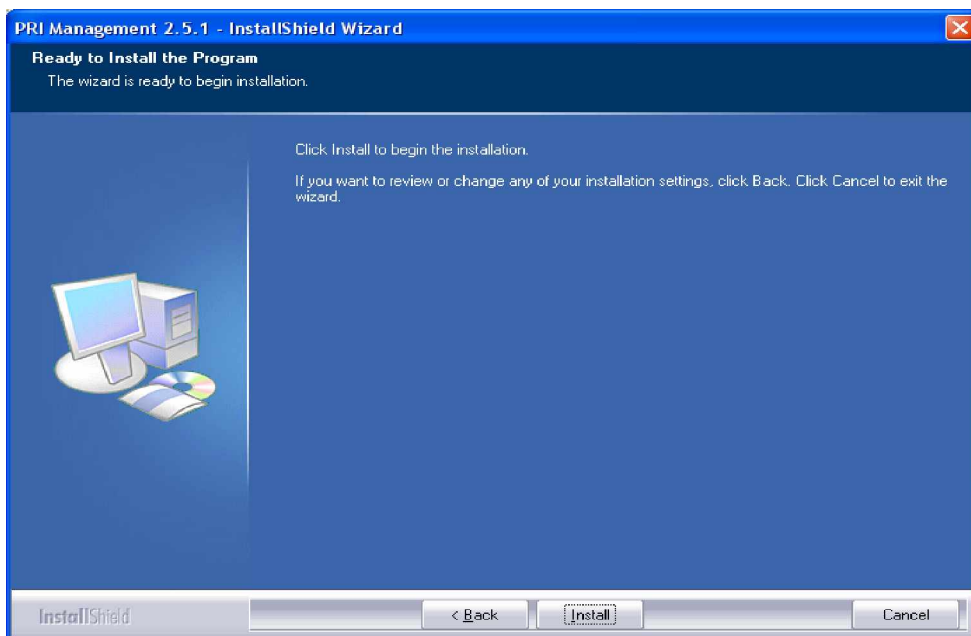

3. Double click  to install the Multi-Cell Manager Application. The Install window will open.

4. Click Next.
5. The Setup Type window will open.

6. Select Complete and click next.
The Begin Installation window will open.

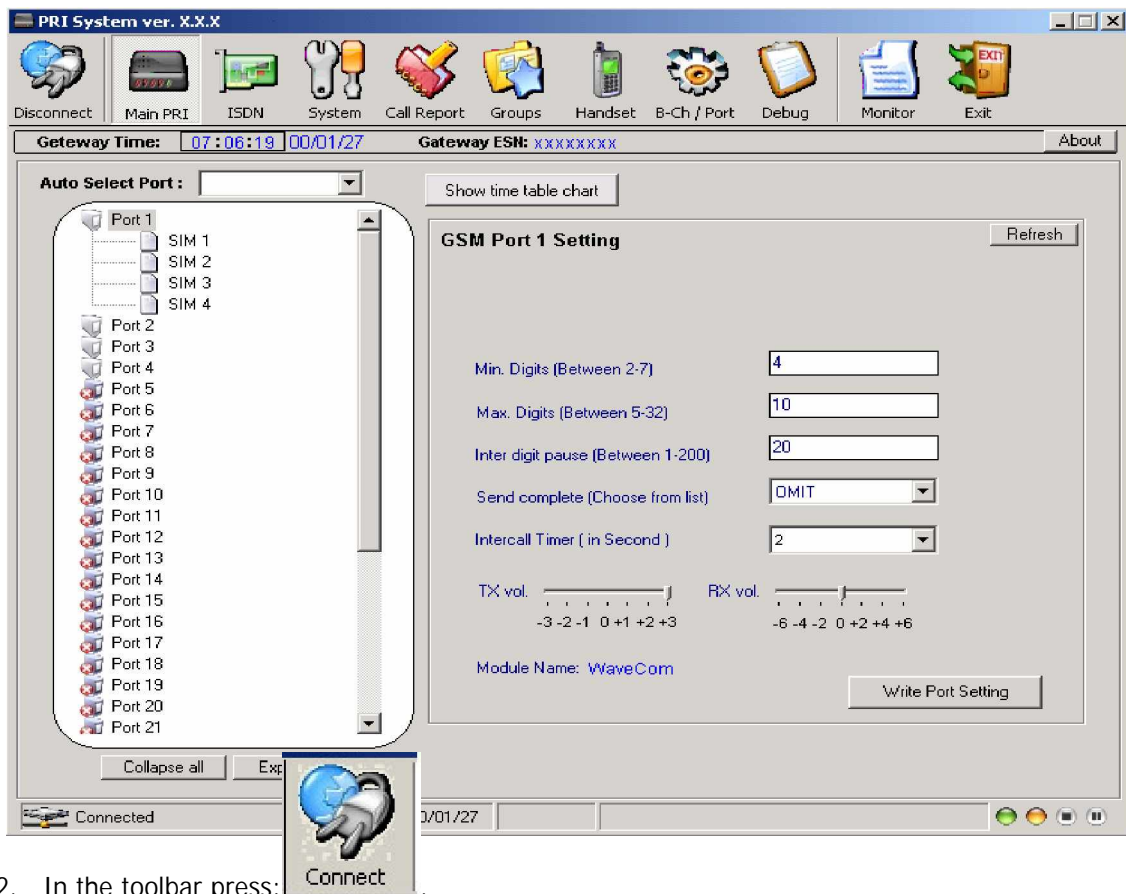

7. Click Install. The Multi-Cell Manager application installs itself. Wait all steps till a completion message will appear.

Chapter 3: Basic configurations with the management application

Launch the Manager Application and Define the Type of Connection Between the management PC and the Multi-Cell system

After installing the manager application, launch it and define the Type of Connection between the Auxiliary Computer and the Multi-Cell as described below.

1. Launch the PRI Manager by pressing  on your computer desktop, or by pressing:
Start > Programs > EuroTech Communications > PRI Manager.
The PRI Manager window opens.

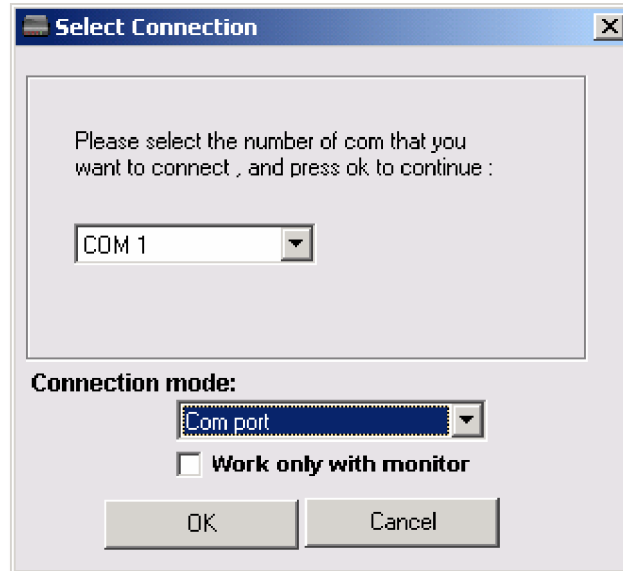

2. In the toolbar press: .
The Select Connection window opens.
3. The configuration computer can be connected to the Multi-Cell in either of two connections the serial RS-232 wire or via Internet. The two options described in the following sub chapters.

Chapter 3.1: Management via RS-232 serial connection

Connect the RS-232 cable following the, from an available communication port in the computer to the Com socket in the back of the Multi-Cell. This is the default setting.

If you are using this type of connection, select Com Port in the bottom frame of the window.

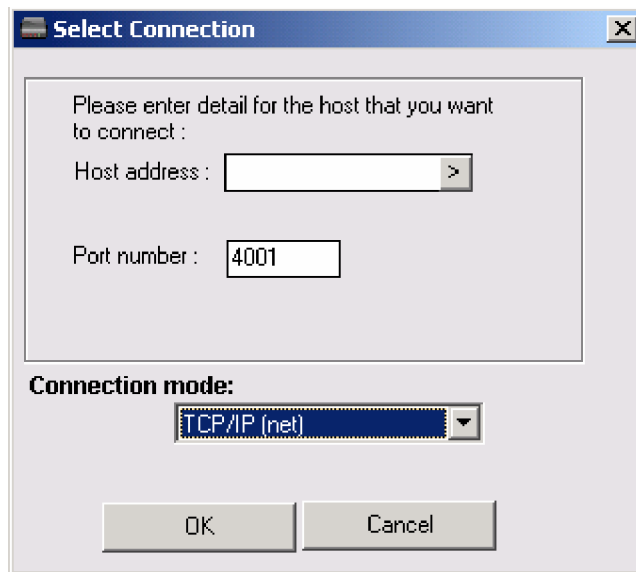

In the selection Pull Down menu, select the computer Com Port you are using for your RS-232 cable connection with the Multi-Cell PRI Gateway.

Chapter 3.2: Management via Internet connection

TCP/IP Internet connection enabled via the "NET" socket (RJ-45) on the Multi-Cell PRI Gateway, in the front of the Multi-Cell. Refer to "Chapter 1: Connecting the Cables" for the cable connection task.

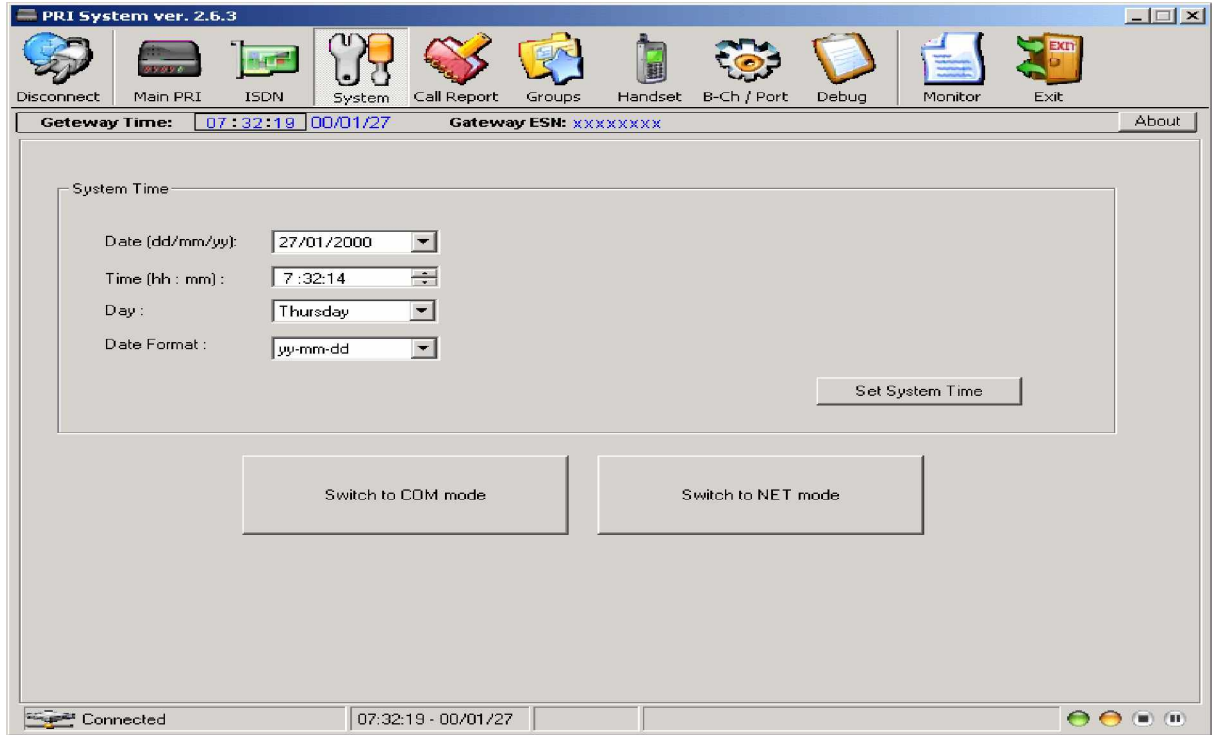

For TCP/IP settings of the Multi-Cell PRI Gateway refer to "Chapter 10: TCP/IP Setting".

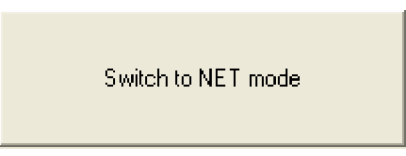

1. If you are using Internet connection for management, select TCP/IP in the bottom frame of the window.

In the top frame, enter the Host address (The Internet address of the Multi-Cell).
Enter 4001 as the IP Port number to be used for the Manager Communication session.

2. Press  button. The System window will open.

3. Press  button.

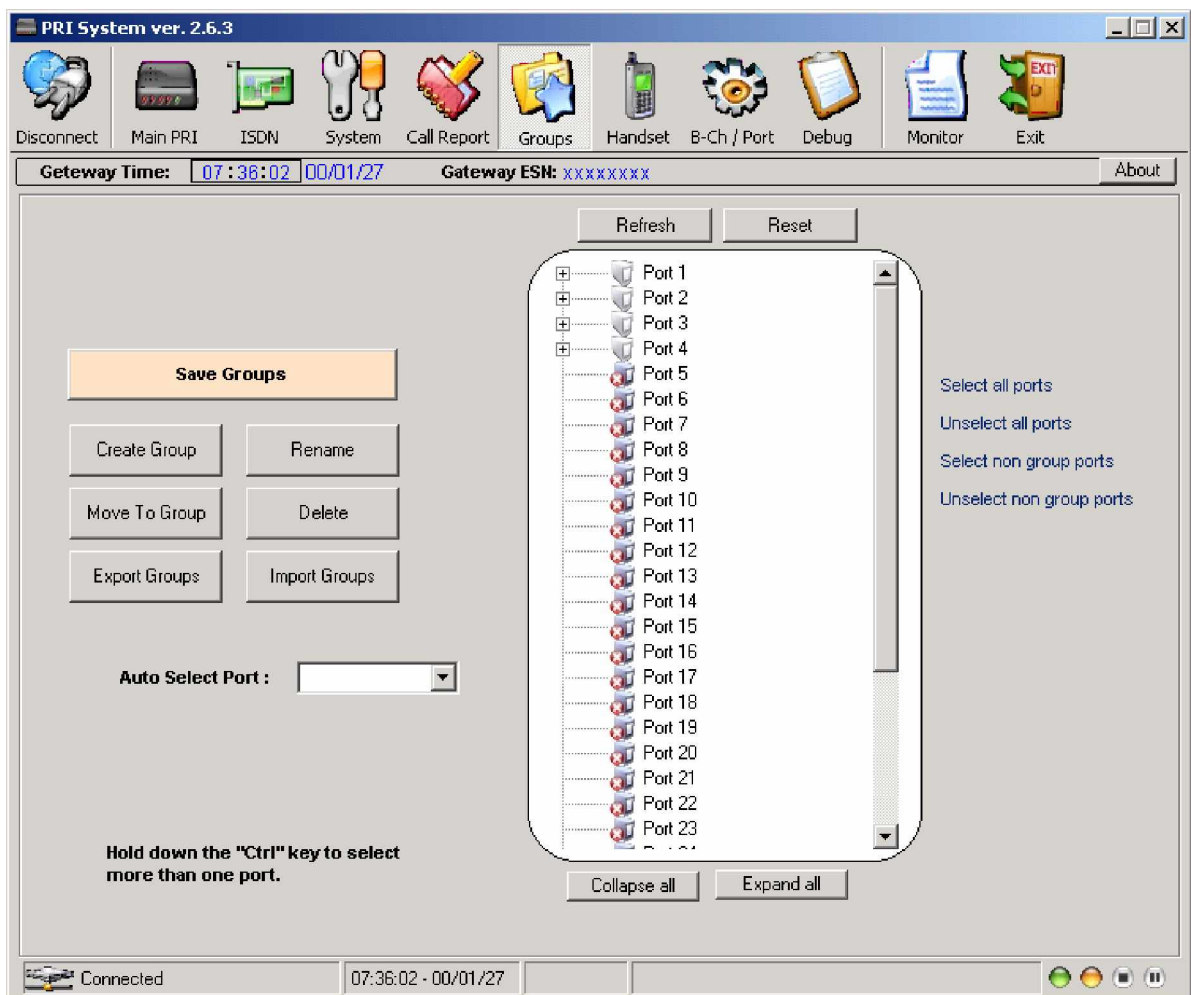

The system is set for TCP/IP communication between the auxiliary PC and the Multi-Cell unit.

Chapter 4: Configuration - Defining Groups of Ports

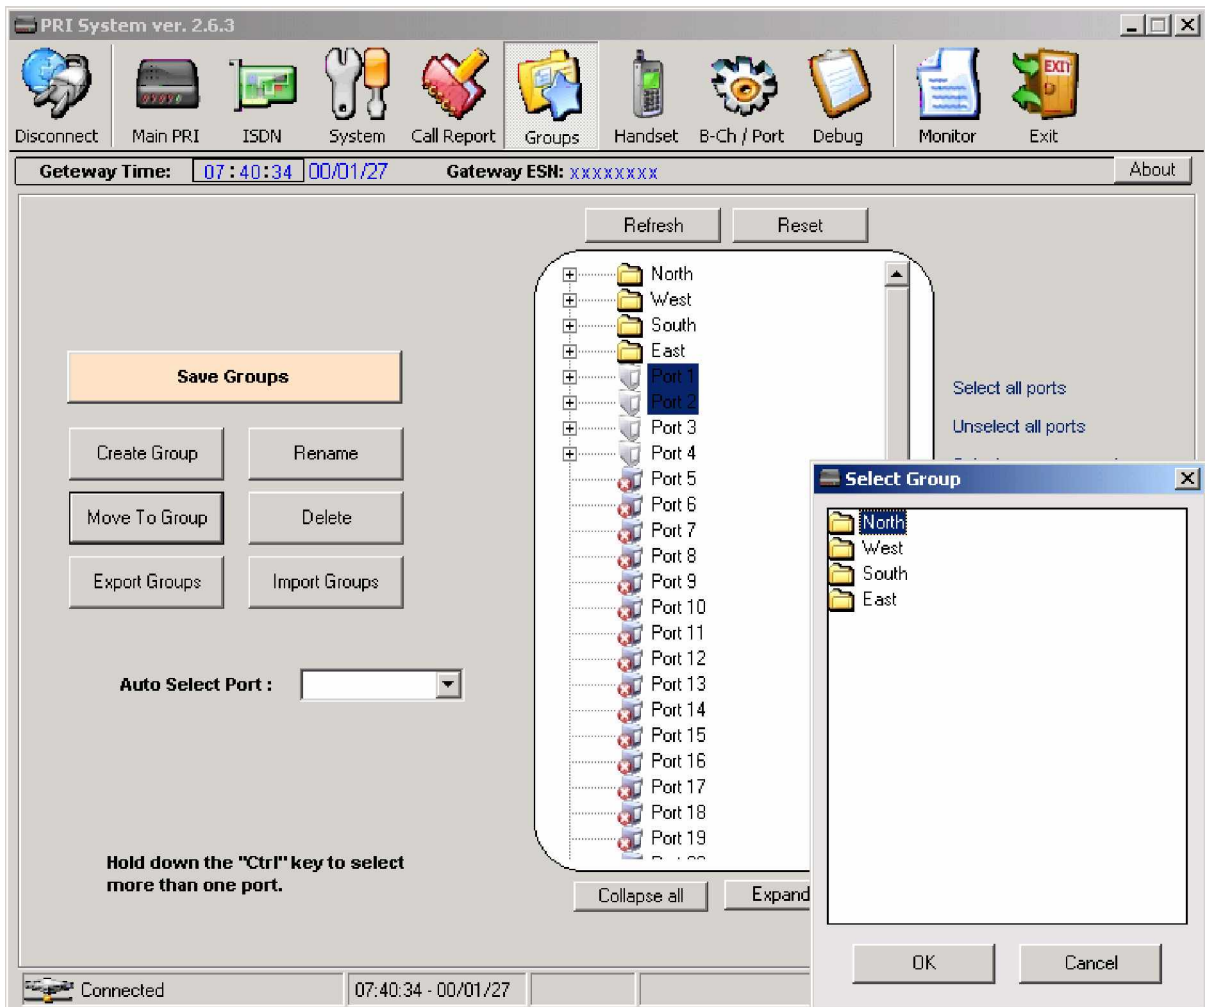

The Multi-Cell PRI unit is a gateway for 30 telephones. Telephones may be divided into groups. For example, each department in your office may have different call patterns. Each port represents one telephone. Define setting for group of ports as follows.

1. Press on **Groups** button on the Manager Menu bar. The Groups window will open.

2. Press [Create Group] button. A new group appears at the bottom of the Port list.
3. Type a name for the new group and click outside the selected area. A group can be renamed by selecting it and pressing [Rename] button.
4. Define the ports in each group:
 - a. Select a port
 - b. Press [Move to Group] button. The Select Group window opens
 - c. Select the desired group of the port.

5. When finished defining groups, press [Save Groups] button to send the group configuration to the Multi-Cell unit.

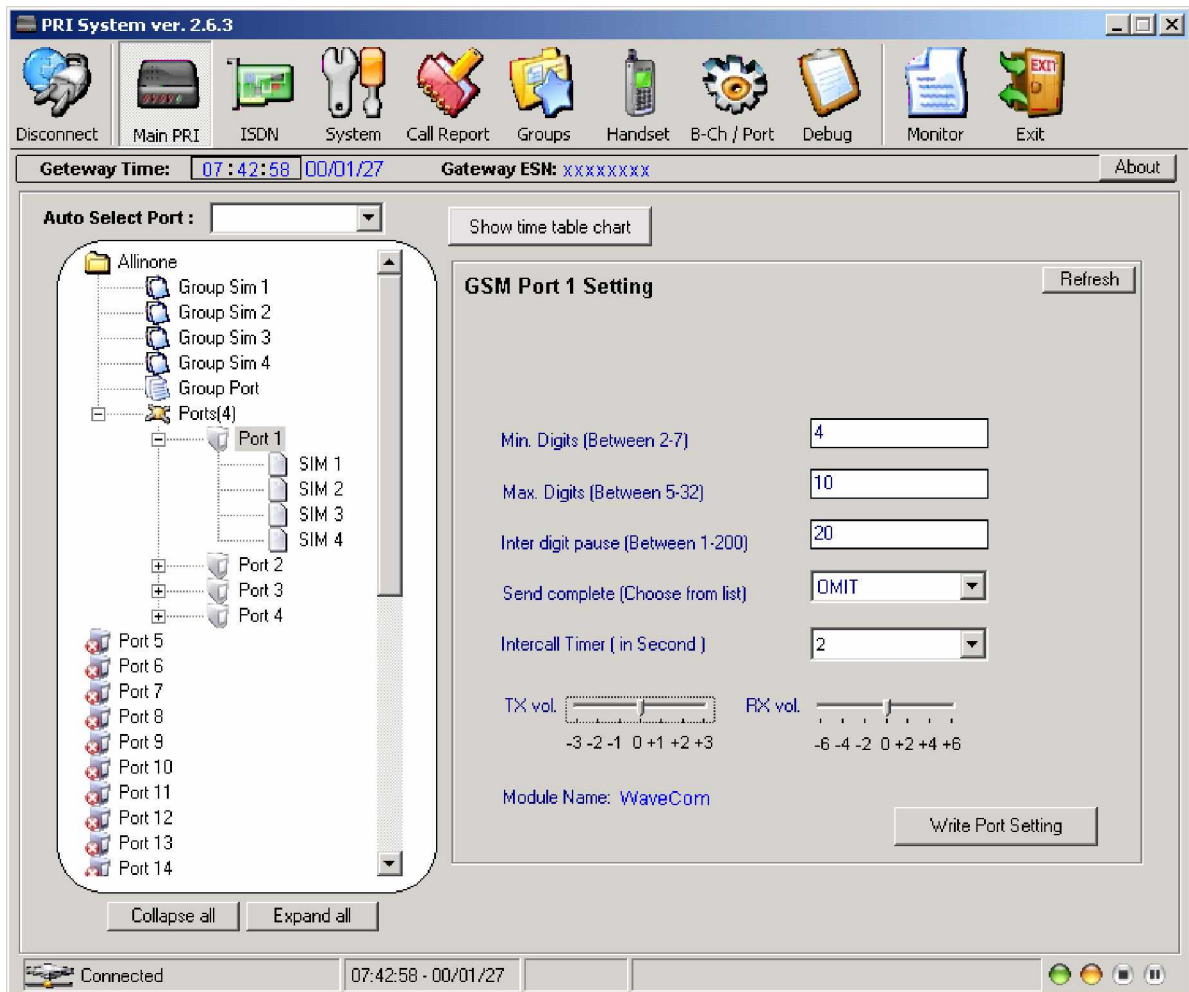

After defining groups, set time tables, make dial settings and define channel locks as described in the following chapter.

Chapter 5: Configuration - Port and SIM

This chapter details port dial settings, as well as time tables and channel locks for SIMs.

Chapter 5.1: Define Dial Settings for Each Port

Press [Main PRI] button to define dial settings for each port. The Port Setting window opens. To define port dial settings, click a port and proceed as described on the following pages.

Select a caller identification option in the Caller ID list:

- To enable the GSM network to set caller ID standards, select "By Network".
- To enable identification of the SIM, select "CLIR Show".
- To disable identification of the SIM, select "CLIR Hide".

Chapter 5.2: Define Phone numbers Type of Dispatch

Select the mode in which telephone numbers are dispatched to the GSM network.

To dispatch phone numbers manually, in the Send Complete list, select HASH mode. In this mode, after the user has dialed all digits of a phone number, press “#” to send the phone number.

To dispatch phone numbers automatically, in the Send Complete list, select OMIT. Then set three additional parameters:

- a. Length of phone numbers that will be dialed from the port within range.
 - i. In the Min. Digits box, enter the number of digits of the shortest phone number that will be dialed from this port.
 - ii. In the Max. Digits box, enter the number of digits of the longest phone number that will be dialed from this port
- b. Inter Digit Pause. This parameter defines a waiting time, after a digit is pressed, before the number is automatically dispatched to the GSM network.

If this parameter is set too low, then incomplete phone numbers may be dispatched if the user pauses briefly while dialing.

If this parameter is set too high, then users would have to wait a long time before a number is dispatched.

The inter digit pause is activated after the minimum number of digits have been dialed.

In many situations, two or three seconds may be appropriate for this parameter.

Each unit of this parameter is 50 milliseconds. For example, to set an inter digit pause of 3 seconds, enter a value of 60 in this box ($60 * 50 \text{ milliseconds} = 3,000 \text{ milliseconds} = 3 \text{ seconds}$).

When a port is set to auto-dispatch phone numbers, after the user has dialed the maximum number of digits, or, when an inter digit pause has occurred, then the number is dispatched automatically.

c. Define Minimum Amount of Time between Outgoing Calls

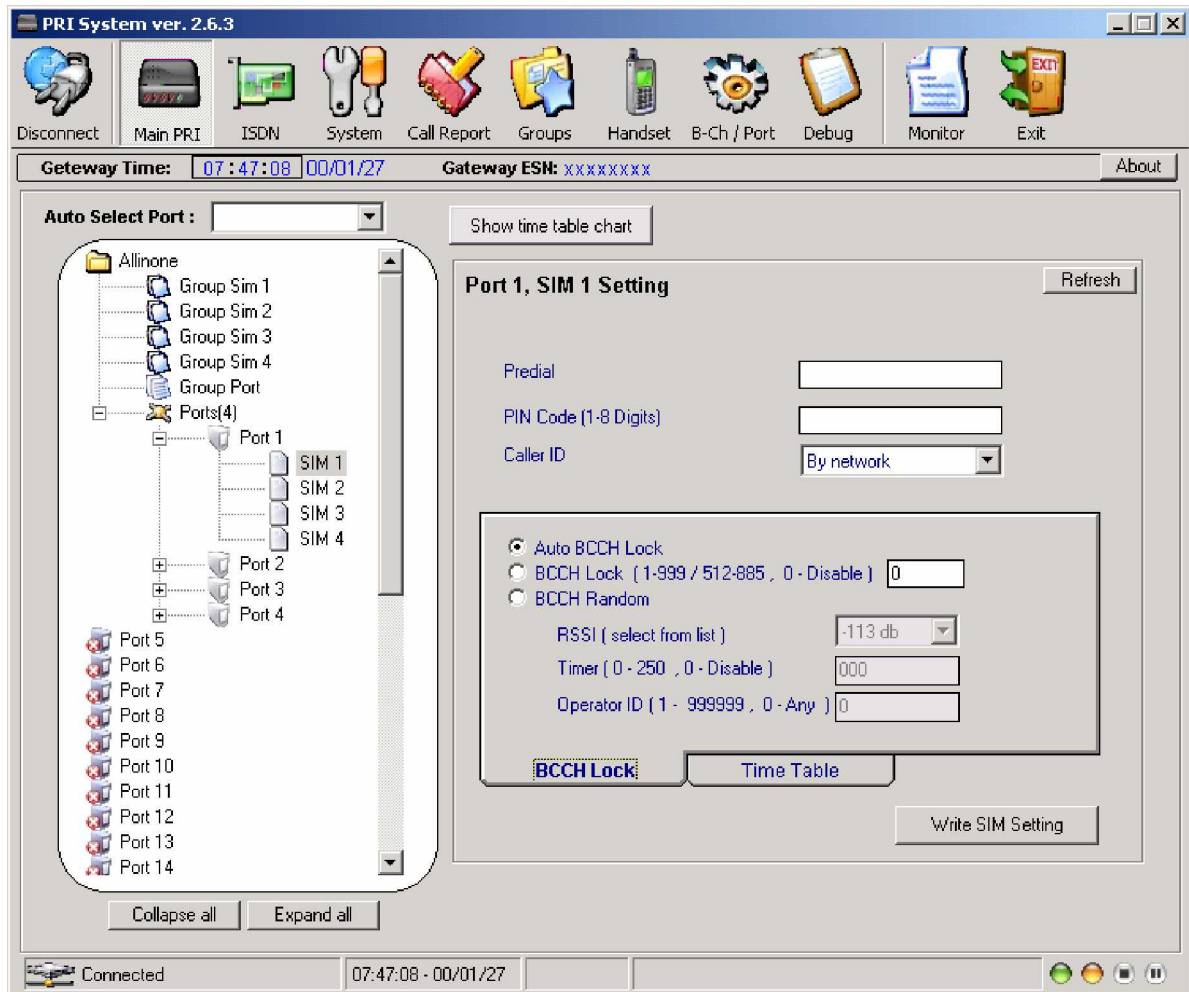

Enter the minimum amount of time between outgoing calls in the Intercall Timer box. Set this parameter according to limitations of the GSM network. In many situations, two seconds may be an appropriate value for this parameter.

The Time Table Chart Button: Click this button to view the settings of time table for SIMs, already set... (The future versions will show the settings of all the SIMs).

After making port settings, press Write Port Setting to send the settings to the Multi-Cell unit. Then make settings for each SIM, as explained in the following section.

Chapter 5.3: Configuration – SIM Card Settings

To define settings for a SIM, click a SIM icon. The SIM Setting window opens.

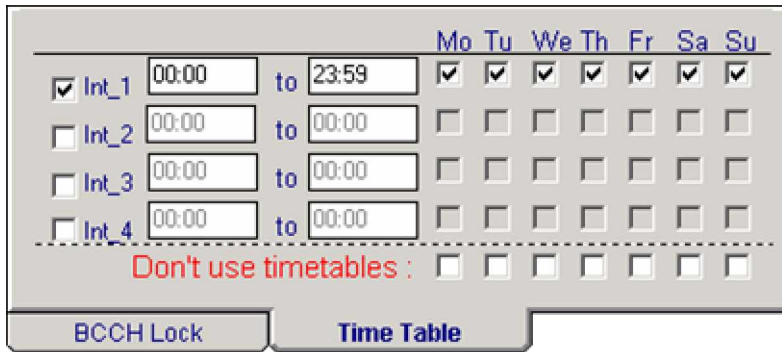

Define SIM Specifications

Enter SIM specifications:

1. Enter a pre-dialing number for the specific SIM.
2. Enter the PIN code of the SIM in the PIN CODE box.
3. Select a caller identification option in the Caller ID list:
 - To enable the GSM network to set caller ID standards, select Network.
 - To enable identification of the SIM, select CLIR Suppression.
 - To disable identification of the SIM, select CLIR Invocation.
4. If desired, set an air-time limit at Maximum Number of Call Minutes.

Set the time passed since SIM begun to be Active

Click the "Time table" tab. The timetable settings will appear:

In the Time Table tab, define hours, and days, that the SIM is active. Days can be divided in up to four intervals.

1. Select an interval.
2. Enter the hours of the interval.
3. Select days that this interval will be activated. Select days of deactivation in the row Don not use timetables.

Define type of Channel Lock

To define the type of channel lock, click the BCCH Lock tab.

Define a channel lock:

- To lock the SIM to the channel with the strongest signal, Select Auto BCCH Lock. This is not recommended. If many SIMs are at this setting, the strongest channel may become overloaded.
- To permanently assign the SIM to a channel, select BCCH Lock, and enter a channel number between 1 - 124, or 512 - 885 (inclusive).
- To rotate the channel, select BCCH Random, and set the following parameters:
 - Select the minimum reception for a channel lock in the RSSI box.
 - At Timer, select a time limit that the SIM is locked to a channel. Select between 1 250 minutes.
 - To enable the GSM network to control channel locks, enter the identification number of the GSM network at Operator ID.

After SIM settings are completed, press Write SIM Settings to send the settings to the Multi-Cell gateway configuration settings.

Chapter 6: Configuration - ISDN Connection Settings

This chapter details ISDN settings starting with overview of the ISDN card in the Multi-Cell PRI gateway system and guiding for proper configuration per your needs.

Chapter 6.1: Overview of the ISDN Card

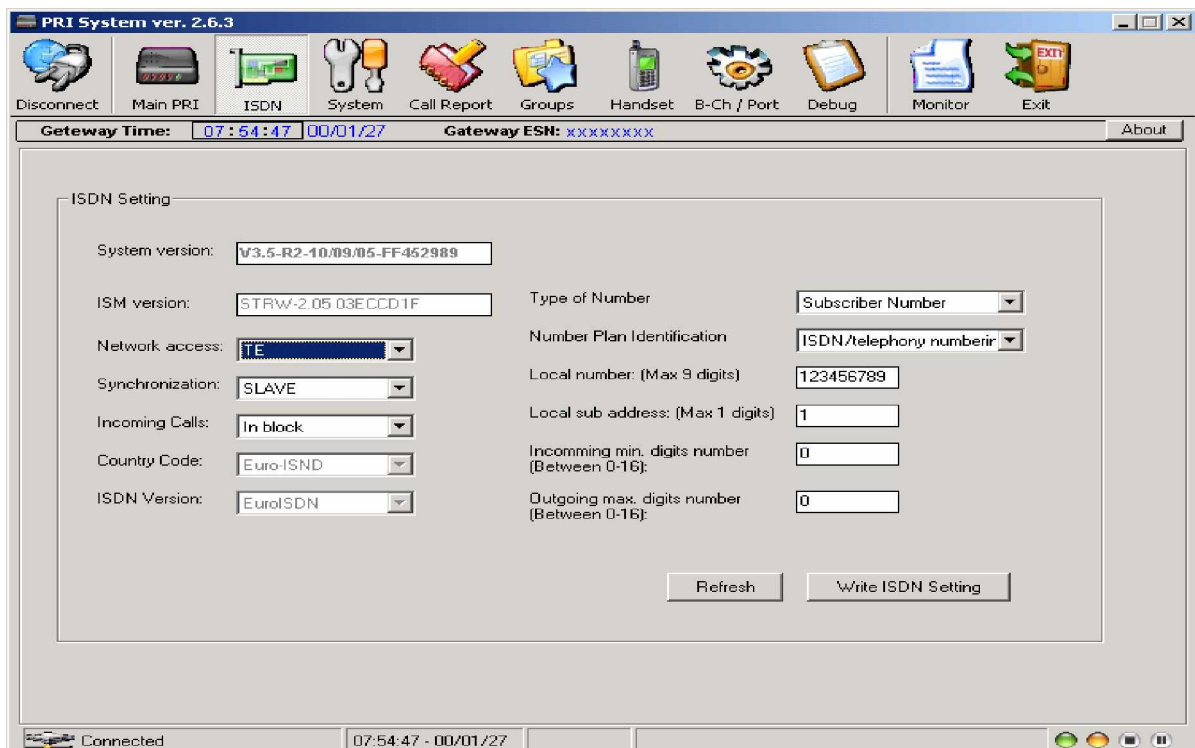

Each Multi-Cell gateway has a master Printed Circuit Board(PCB). The ISDN card is a small PCB mounted on the master PCB. The ISDN card is between ports in the Multi-Cell and the switching unit.

To define ISDN settings, press.

The ISDN window will open.

This window defines settings in the E1 line, between the switching unit and the ISDN card. Enter specifications as described on the following page. Ensure that settings are in conformity with settings in the switching box.

1. The control PCB has an EEPROM containing master card software. Enter the version of the master card software in System Version.

2. The ISDN module is a small PCB connected to the master PCB. The ISDN module has an

EEPROM containing ISM software. Enter the ISM version in the ISM version box.

3. Set Network access as NT, (set the switching unit as TE).
4. Define the Master/Slave status in the Synchronization box. It is preferable to define the Multi-Cell unit as the Master, and the switching unit as the slave.
5. In the Incoming Calls box, select the interface of incoming calls (from the switching unit to the ISDN card), **Overlap** (pulse) or **In Block** (packet) in conformity with the setting in the switching unit.
 - If **Overlap** is selected, then proceed to step 6. Do not place entries in the last two parameters
 - If **In Block** is selected, then place entries in the ring signal parameter
 - **Incoming Min. Digits Number**
This parameter determines when a ring signal will be initiated in calls coming from switching box, to the ISDN card. Enter the minimum number of digits of incoming phone numbers in this box (for example 050 787-444 = 10 digits).
 - **Outgo the Max. Digits Number**
This parameter determines when a ring signal will be initiated in calls coming from the ISDN card, to the switching box. Enter the minimum number of digits of incoming phone numbers in this box (for example 6001 = 4 digits).
6. In the Type of Number box, select the type of number (TON) of calls (from the ISDN card to the switching unit), as defined in the switching unit.
7. The protocol of numbers (from the ISDN card to the switching unit) is set at Number Plan Identification (NPI). Set this parameter as defined in the switching unit.
8. Each Multi-Cell has a part number. Enter the part number of your Multi-Cell in the Local number box.
9. If you have more than one Multi-Cell on site, enter the sub address of each Multi-Cell unit in the Local sub address box.
10. Press **Write ISDN Setting** button to send the ISDN settings to the Multi-Cell unit.

Chapter 6.2: Configuration - ISDN B-Channel-Port Association

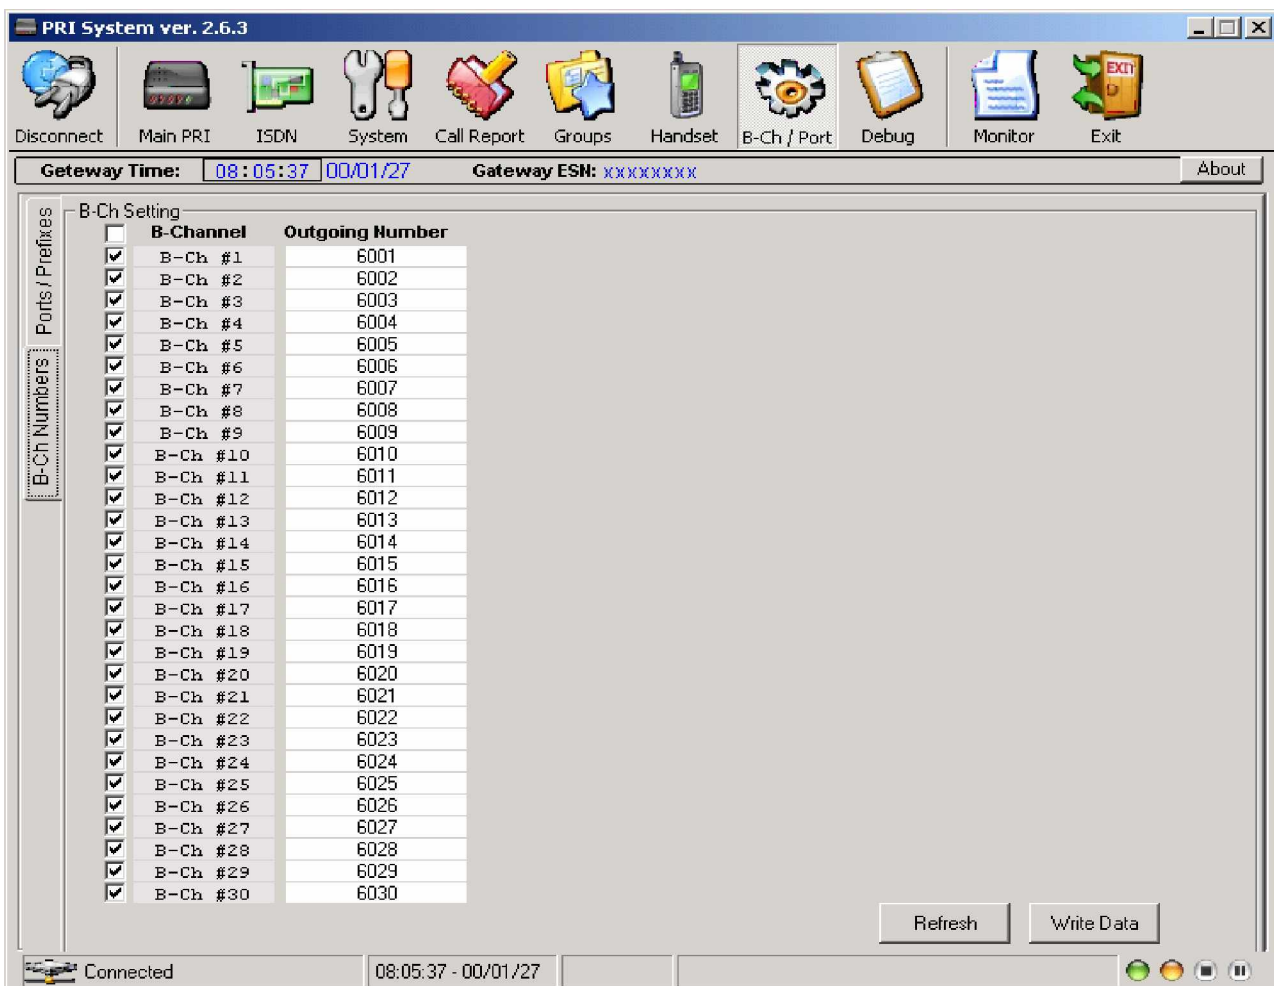

This chapter explains the assigning of B-channels to in-house phones and the allocation of calls to Multi-Cell ports.

Chapter 6.2.1: Assigning B-channels to In-house Numbers

Assigned B-channels to ports in the switching unit as follows:

1. Press **B-Ch / Port** to open the B-Channel/Port window.
2. Press the B-Ch Numbers tab.

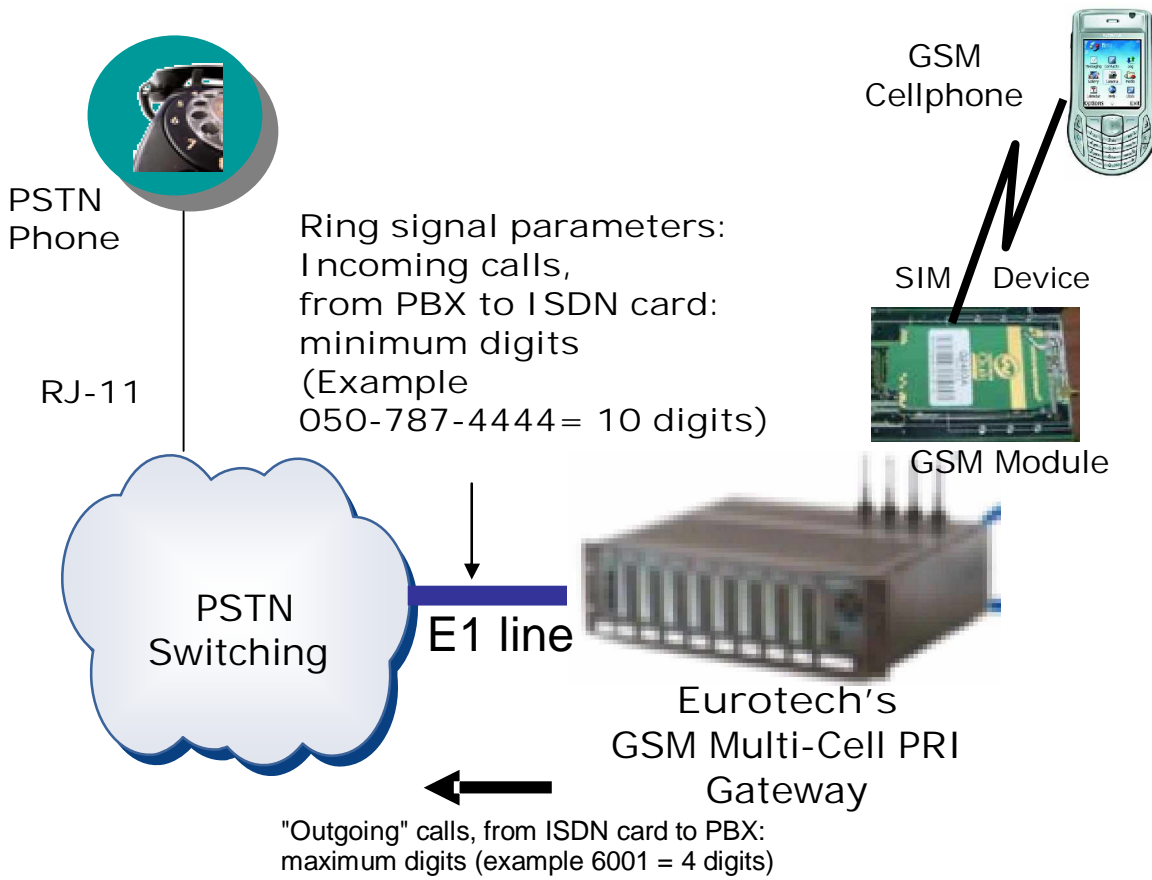

The screenshot shows the 'PRI System ver. 2.6.3' software interface. The 'B-Ch / Port' menu item is selected in the top toolbar. The main window displays the 'B-Ch Setting' configuration screen. On the left, there are two tabs: 'Ports / Prefixes' and 'B-Ch Numbers', with 'B-Ch Numbers' being the active tab. The main area contains a table with the following data:

B-Channel	Outgoing Number
<input type="checkbox"/> B-Ch #1	6001
<input type="checkbox"/> B-Ch #2	6002
<input type="checkbox"/> B-Ch #3	6003
<input type="checkbox"/> B-Ch #4	6004
<input type="checkbox"/> B-Ch #5	6005
<input type="checkbox"/> B-Ch #6	6006
<input type="checkbox"/> B-Ch #7	6007
<input type="checkbox"/> B-Ch #8	6008
<input type="checkbox"/> B-Ch #9	6009
<input type="checkbox"/> B-Ch #10	6010
<input type="checkbox"/> B-Ch #11	6011
<input type="checkbox"/> B-Ch #12	6012
<input type="checkbox"/> B-Ch #13	6013
<input type="checkbox"/> B-Ch #14	6014
<input type="checkbox"/> B-Ch #15	6015
<input type="checkbox"/> B-Ch #16	6016
<input type="checkbox"/> B-Ch #17	6017
<input type="checkbox"/> B-Ch #18	6018
<input type="checkbox"/> B-Ch #19	6019
<input type="checkbox"/> B-Ch #20	6020
<input type="checkbox"/> B-Ch #21	6021
<input type="checkbox"/> B-Ch #22	6022
<input type="checkbox"/> B-Ch #23	6023
<input type="checkbox"/> B-Ch #24	6024
<input type="checkbox"/> B-Ch #25	6025
<input type="checkbox"/> B-Ch #26	6026
<input type="checkbox"/> B-Ch #27	6027
<input type="checkbox"/> B-Ch #28	6028
<input type="checkbox"/> B-Ch #29	6029
<input type="checkbox"/> B-Ch #30	6030

At the bottom right of the window, there are 'Refresh' and 'Write Data' buttons. The status bar at the bottom shows 'Connected', the time '08:05:37 - 00/01/27', and system icons.

3. Mark the B-Ch setting, in order to activate all B-channels. Unmark a B-channel to deactivate it.

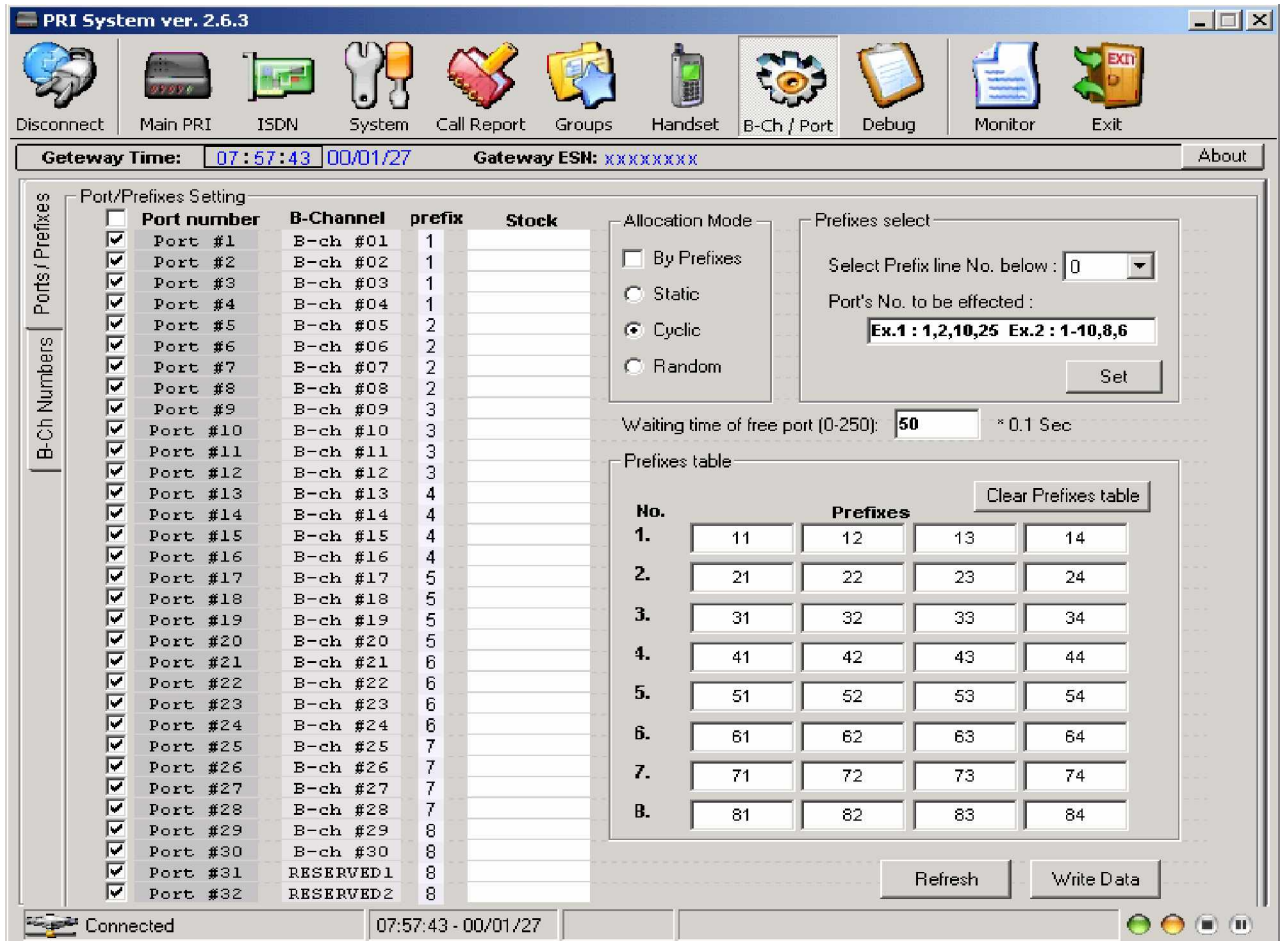

The Outgoing Number column refers to calls from the Multi-Cell, to a phone extending from the switching unit, as illustrated above.

4. In the Outgoing Number column, for each B-channel, enter a number for a phone extending from the switching unit.
5. Press Write Data to send the B-channel settings to the Multi-Cell.

Chapter 6.2.2: Assigning Ports and Defining Prefixes

This section explains how to assign a port allocation mode for the Multi-Cell. A port allocation mode determines the manner in which a port is selected when placing a call from a phone extending from the switching unit, to a GSM network phone.

1. In the B-Channel/Port window press the Ports/Prefixes tab. The default alignment of B-channels to ports is displayed. B-channels can be reassigned to different ports by dragging them. Use the Stock column as a buffer when reassigning ports.

The screenshot shows the 'B-Ch / Port' configuration window in the PRI System software. The window title is 'PRI System ver. 2.6.3'. The main area is titled 'Port/Prefixes Setting' and contains a table with the following columns: Port number, B-Channel, prefix, and Stock. The table lists ports from #1 to #32, with B-channels #01 to #30 and two reserved channels. The 'Stock' column shows values ranging from 1 to 8. To the right of the table are several configuration options:

- Allocation Mode:** Includes checkboxes for 'By Prefixes', 'Static', 'Cyclic' (selected), and 'Random'.
- Prefixes select:** Includes a dropdown for 'Select Prefix line No. below:' (set to 0) and a text field for 'Port's No. to be effected:' (set to 'Ex.1 : 1,2,10,25 Ex.2 : 1-10,8,6').
- Waiting time of free port (0-250):** Set to 50 * 0.1 Sec.
- Prefixes table:** A grid with 8 rows (labeled 1. to B.) and 4 columns (labeled 11 to 84). A 'Clear Prefixes table' button is located above the grid.

At the bottom of the window, there are 'Refresh' and 'Write Data' buttons. The status bar at the very bottom shows 'Connected' and the time '07:57:43 - 00/01/27'.

2. Mark the Port number to activate all ports. Deactivate individual ports by unmarking them.

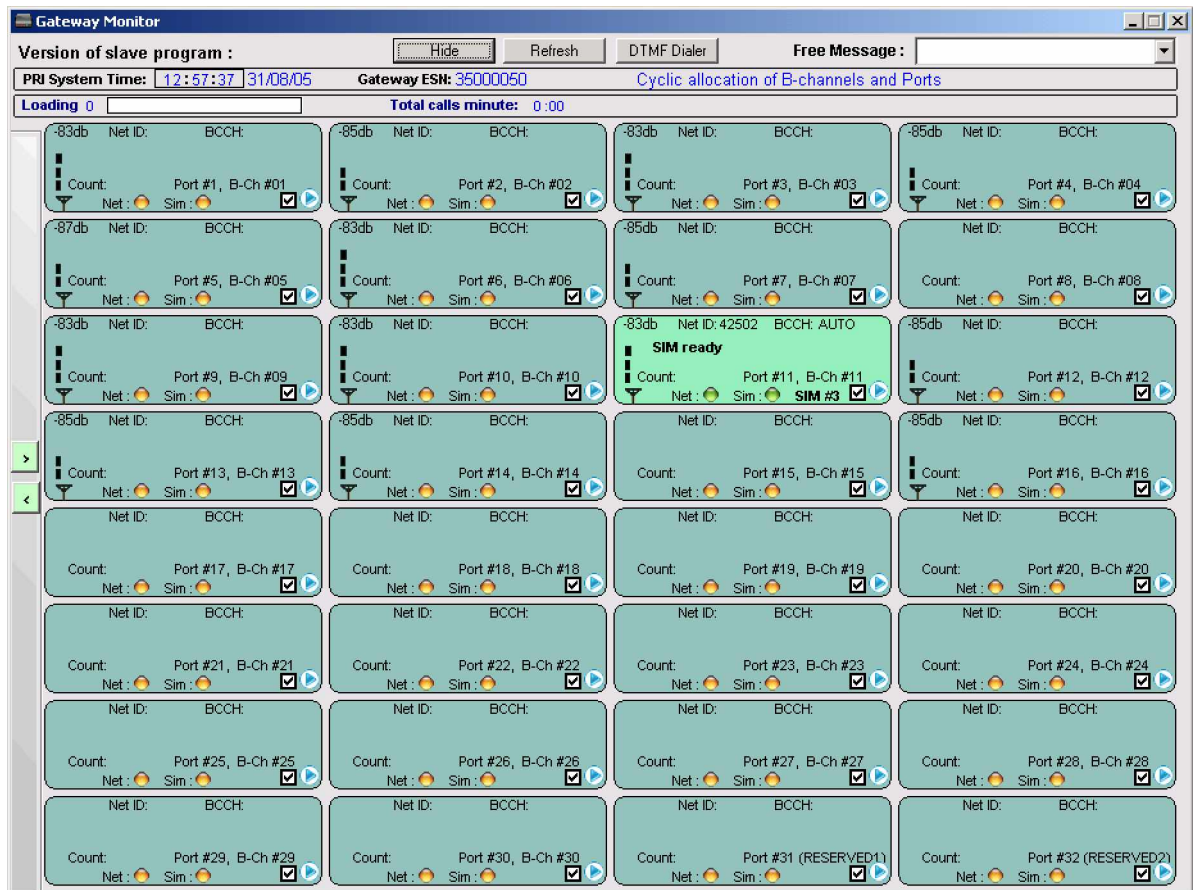

3. In the Allocation frame, select the type of Allocation Mode desired.
 - Static allocation: Each B-channels is permanently assigned to a port (GSM module), as they are aligned in this tab.
 - Cyclic allocation: As each phone call is made, the next available port (GSM module) is assigned to the B-channel.
 - Random allocation: Any available port (GSM module) is assigned to the B-channel.
 - Allocation By Prefixes: The B-channel of the source call is assigned to a port (GSM module) by the prefix of the out-going telephone number.
 - Up to eight groups of prefixes can be allocated. For example, eight different GSM networks, each with four prefixes, could be used:
 - i. Enter prefixes, in their desired groups, in the Prefix Table.
 - ii. In the Prefix Group column, assign each port a group of prefixes (groups 1-8).
4. After assigning ports, press Write Data to send the port settings to the Multi- Cell unit.

Chapter 8: Monitoring Calls

This chapter explains how to monitor calls and review reports.

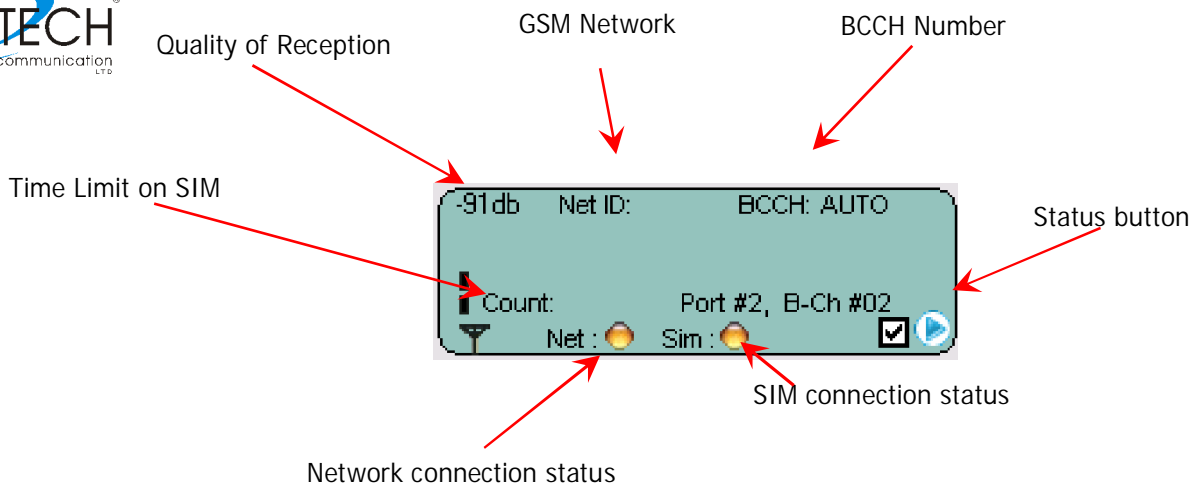

To monitor calls press **Monitor**. The monitor screen will open.

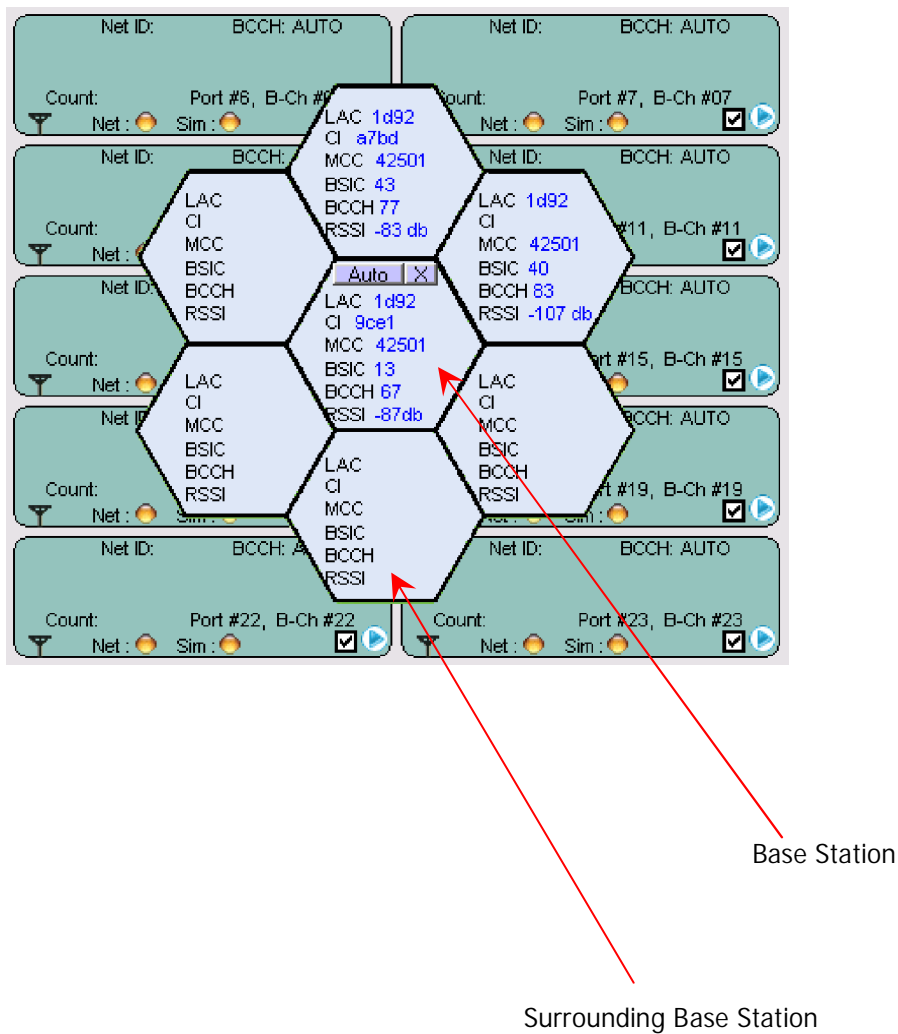

Press  to hide or view B-channel status, as well as the status of the following connections:

- Comport
- Network
- ISDN

A red LED indicates there is no connection. A yellow LED indicates there is a connection, but no data transfer. A green LED indicates transfer of data.

Choose the "Get Cell Information" at the Status Button.

Legend:

- ◆ LAC Location Area Code.
- ◆ CI Cell ID
- ◆ MCC Mobile Country Code
- ◆ BSIC Basic Station Identity Code
- ◆ BCCH Broadcast Control Channel
- ◆ RSSI Receiver Signal Strength

Status button: Click this button, to view additional options to work with...

Additional options:

- Enable/Disable Port: Choose to enable, or disable the current port;
- Refresh Port: Refresh the current port;
- DTMF Dialer: Engage the built in DTMF dialer, allows sending DTMF signals;
- Get Cell Information: Choose this to get the Cell Information, described below;
- Reset Ports X, X: Reset the following ports;
- Reset Statistics: Choose the SIM you want to reset statistics for;
- Read Statistics: Choose the SIM you want to read statistics of;

SIM's Statistics:

Statistics for sim : 3 ,Port : 1

Minutes of the conversation : 03863:39

Number dialed calls : 4004

Number success calls : 1791

ASR : 44.73 %

ACD : 02 Minutes 09 Seconds

Close

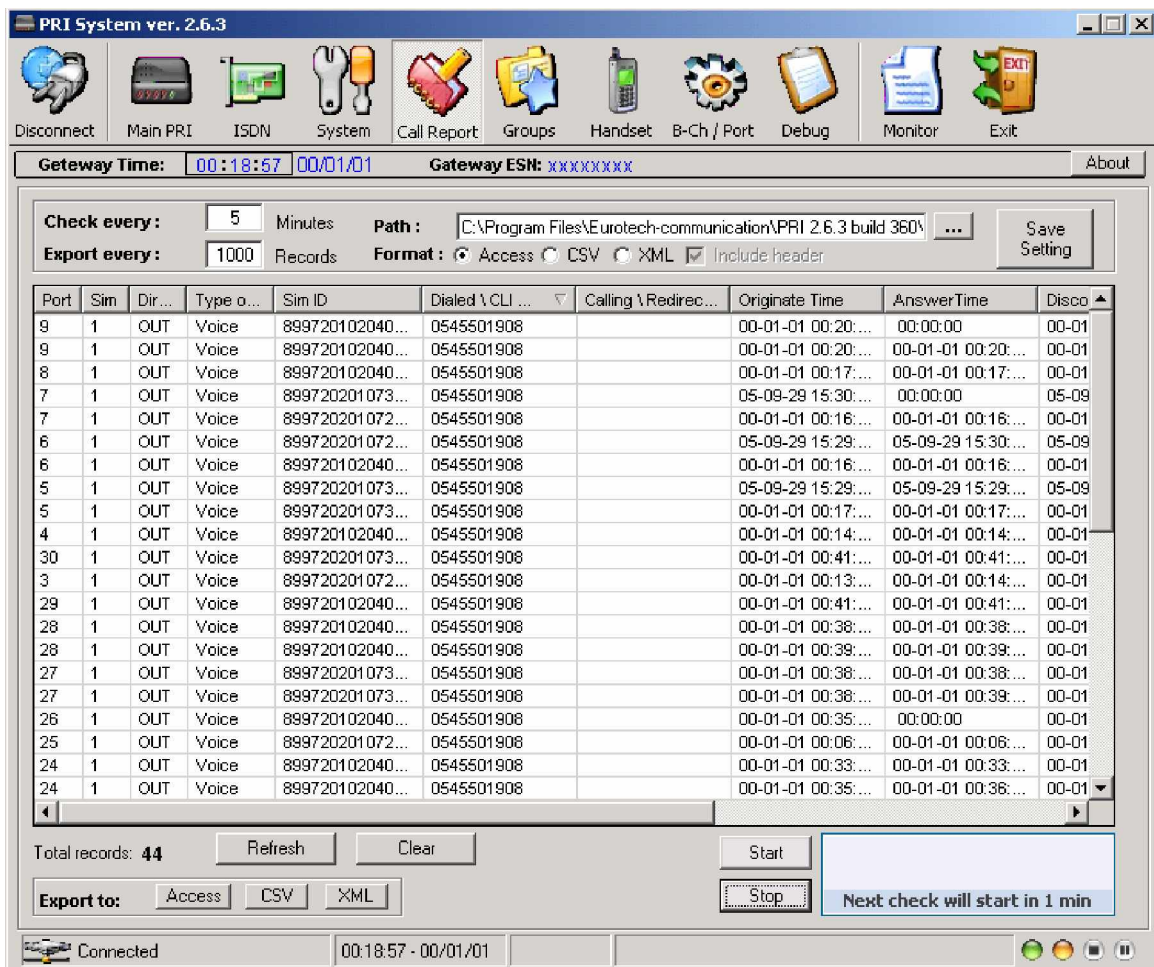

- Minutes of the conversation: Total call minutes, accumulated, on current SIM;
- Number dialed calls: Total number of calls made via the current SIM;
- Number success calls: Number of successful calls made via the SIM;
- ASR: The percentage of successful calls;
- ACD: Average time off total calls made via the SIM;

Chapter 9: Generating Call Reports

Press **Call Report** to review the call report. This screen defines the parameters for a successful or unsuccessful call. The system may store 30,000 calls with full reports for 30 channels without PC! The system may export these reports to MS-Access, CSV (MS-Excel) or standard XML format.

The export of call records will be time based. The time is set in "Check every X minutes" field; The export of calls to file may be done automatically and may be set in the "Export every X records" field; Automatic CDR Screen file to be moved to the PC, this action will erase this CDR s from the unit!

The screenshot shows the 'Call Report' configuration window in the PRI System software. The window title is 'PRI System ver. 2.6.3'. The 'Call Report' icon is highlighted in the top toolbar. The configuration fields are as follows:

- Gateway Time:** 00:18:57 00/01/01
- Gateway ESN:** xxxxxxxx
- Check every:** 5 Minutes
- Export every:** 1000 Records
- Path:** C:\Program Files\Eurotech-communication\PRI 2.6.3 build 360\
- Format:** Access CSV XML Include header
- Buttons:** Save Setting, Start, Stop

The data table below shows a list of call records with columns: Port, Sim, Dir..., Type o..., Sim ID, Dialed \CLI..., Calling \Redirec..., Originate Time, AnswerTime, and Disco.

Port	Sim	Dir...	Type o...	Sim ID	Dialed \CLI...	Calling \Redirec...	Originate Time	AnswerTime	Disco
9	1	OUT	Voice	899720102040...	0545501908		00-01-01 00:20:...	00:00:00	00-01

27	1	OUT	Voice	899720201073...	0545501908		00-01-01 00:38:...	00-01-01 00:38:...	00-01
27	1	OUT	Voice	899720201073...	0545501908		00-01-01 00:38:...	00-01-01 00:39:...	00-01
26	1	OUT	Voice	899720102040...	0545501908		00-01-01 00:35:...	00:00:00	00-01
25	1	OUT	Voice	899720201072...	0545501908		00-01-01 00:06:...	00-01-01 00:06:...	00-01
24	1	OUT	Voice	899720102040...	0545501908		00-01-01 00:33:...	00-01-01 00:33:...	00-01
24	1	OUT	Voice	899720102040...	0545501908		00-01-01 00:35:...	00-01-01 00:36:...	00-01

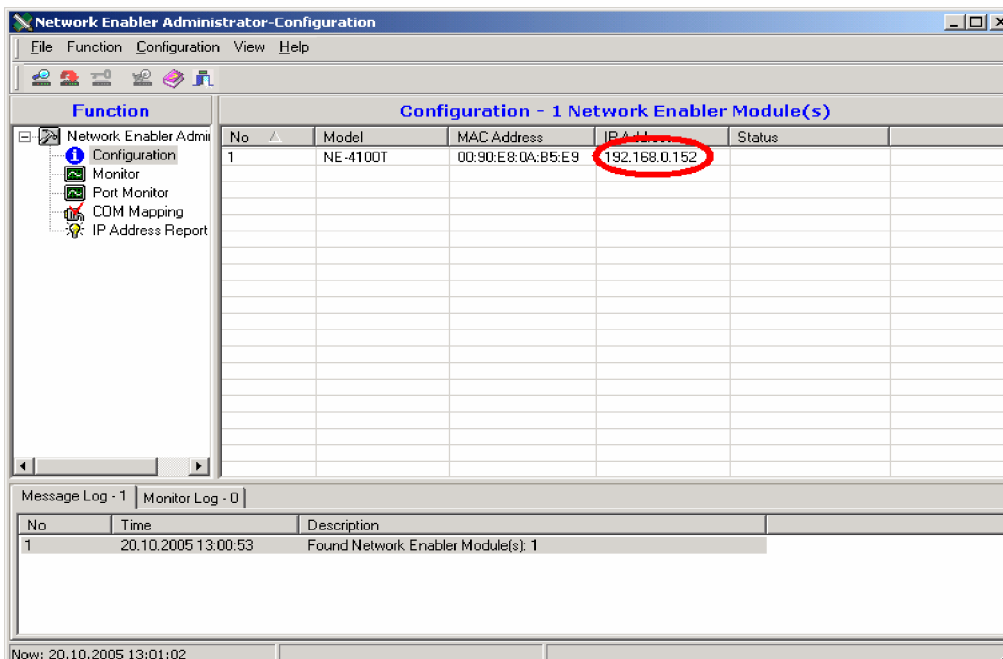

At the bottom of the window, it shows 'Total records: 44', 'Refresh', 'Clear', 'Start', 'Stop', and 'Next check will start in 1 min'. The status bar at the very bottom indicates 'Connected' and the time '00:18:57 - 00/01/01'.

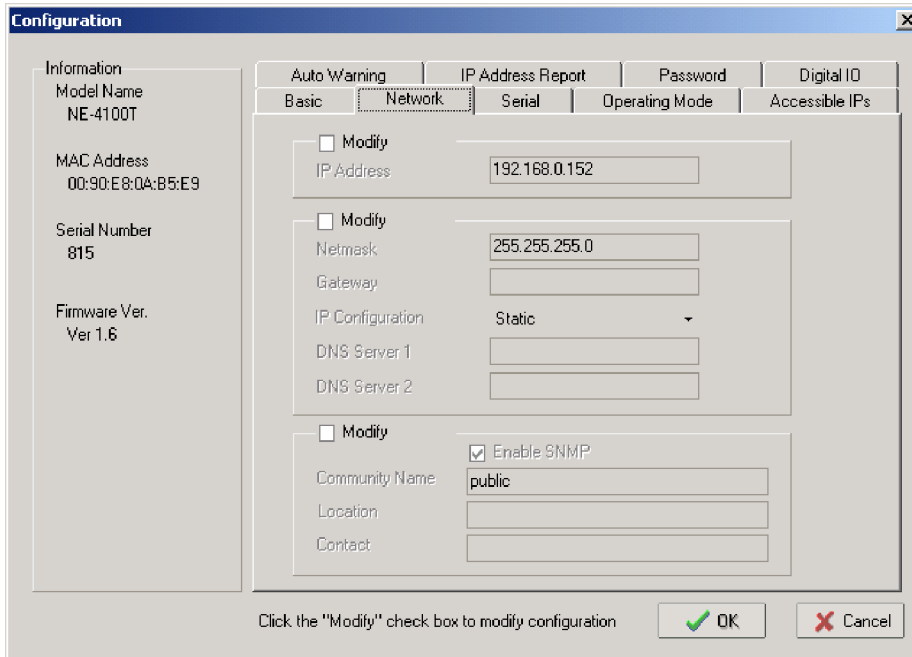

Manual command to Export files of CDR to PC in the following format, Access, CVS (Excel) or XML. This action will not erase the current CDRs from the unit.

Chapter 10: TCP/IP Setting

TCP/IP settings task list:

1. Disconnect the COM cable from the Multi-Cell system.
2. Install RJ-45 cable to the Management PC connected to the Multi-Cell network.
3. Execute to the same LAN "Network Enabler Administrator" program, provided on the installation CD at the directory "LAN Tools";
4. If your IP addresses are between 192.168.0.1 and 192.168.0.255, connect the Multi-Cell to LAN access point and continue to step 6, if other, then proceed to the next step;
5. Connect the Multi-Cell system to the management PC, with Network Enabler installed on it, via a NET Cross connect cable, supplied in the package.
Refer to : "Chapter 1: Connecting the Cables" for more details.
6. Set the PC's IP to 192.168.0.XXX, where XXX is the three last digits of the ESN, written on a sticker, attached to the Multi-Cell, added to 101;
7. Engage the Network Enabler;
8. Click the [Search] button to begin the search;
9. The Multi-Cell's IP should appear in the next screen:
10. Double click on the IP. Then Press the Network tab. The next screen will open:

11. Check the Modify check box above the IP Address and enter the desired IP;
12. In case the Multi-Cell system and the PC were connected with a cross cable, disconnect the cross cable, and reconnect the PC and the Multi-Cell to the LAN;

Chapter 11: Operational test

From a PSTN Office phone attached to a PBX/ VoIP Gateway try make a call to defined GSM Cellphone in the GSM network around.

In case of a failure to do so verify the following:

- The PRI is configured properly to your PBX / VoIP gateway
- The connection is not properly attached or disconnected
- The cable itself is malfunction

If your verifications did not yet any results, It might be that the GSM module is not compatible with the GSM network around.

Make the following handset test which is mainly to check the operation and compatibility of the Multi-Cell System with the local GSM network.

Use a handset with RJ-11 connection and plug it to the HS-Slot in the PRI system.
Follow the handset test instruction as follows:

Make a test call as follows:

Press the "Handset" button:

The next screen will appear:

To continue you must enter your admin username and password

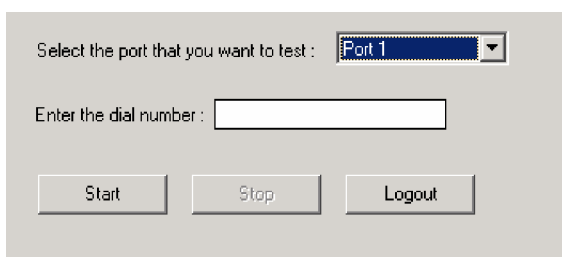

Username :

Password :

Enter the default username and password which are: **admin**

Note: Make sure "Caps Lock" is off and that you entered a lower case characters!

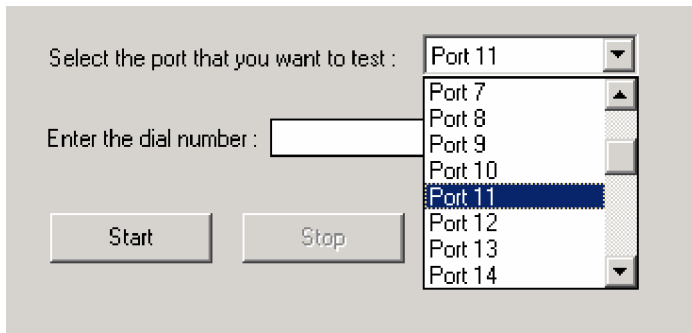

Fill out those dialog boxes and click "Logon" button; you'll see the next screen:

Select the port that you want to test :

Enter the dial number :

Press the "Monitor" window button, it will open showing a pull down set of physical port numbers.

Choose the wanted port, for your testing. Enter the desired phone number in the field named "Enter the dial number"

below and press the  button. In few seconds the GSM phone shall ring and after call accepted, check the voice call operating properly, between the attached RJ-11 handset and the called GSM mobile phone.

In case of failure it might be that:

- GSM signal is too low
- The GSM modules are not compatible with the GSM network around.
- The SIM installed is not compatible with the Multi-Cell system.
Note: We are using SIM of 3V only (5V SIMs or other voltage will not work).
- The SIM card used requires a pin code.

In case you still have errors to operate the system it is recommended to review the "Getting Started" chapter tasks and make sure you did follow the instructions properly.

Still you have problems after doing the "Getting Started" tasks list review above your shall refer to "Chapter 12: Troubleshooting and known issues".

WARNINGS!

- The call is NOT FREE and will be charged from the SIM registered billing account, by your GSM supplier!
- Press "Logout" button to terminate the call and to exit from the test mode.

Chapter 12: Troubleshooting and known issues

The following are main debugging tools which are very useful to overcome connection problems:

- The RJ-11 handset,
- The PRM Manager Debug Window.

Chapter 12.1: The Handset

1. To use a handset, press **Handset** button.
The Handset window will open attached to the Multi-Cell, added to 101.
2. In the Username and password fields, enter "admin" in lower case.
3. Press Logon button.
4. Check the connections with the handset RJ-11 and the HS-Slot in the PRI system are properly connected. Note that The handset maybe used to check the compatibility of the Multi-Cell with the local GSM network available in your area.

To continue you must enter your admin username and password

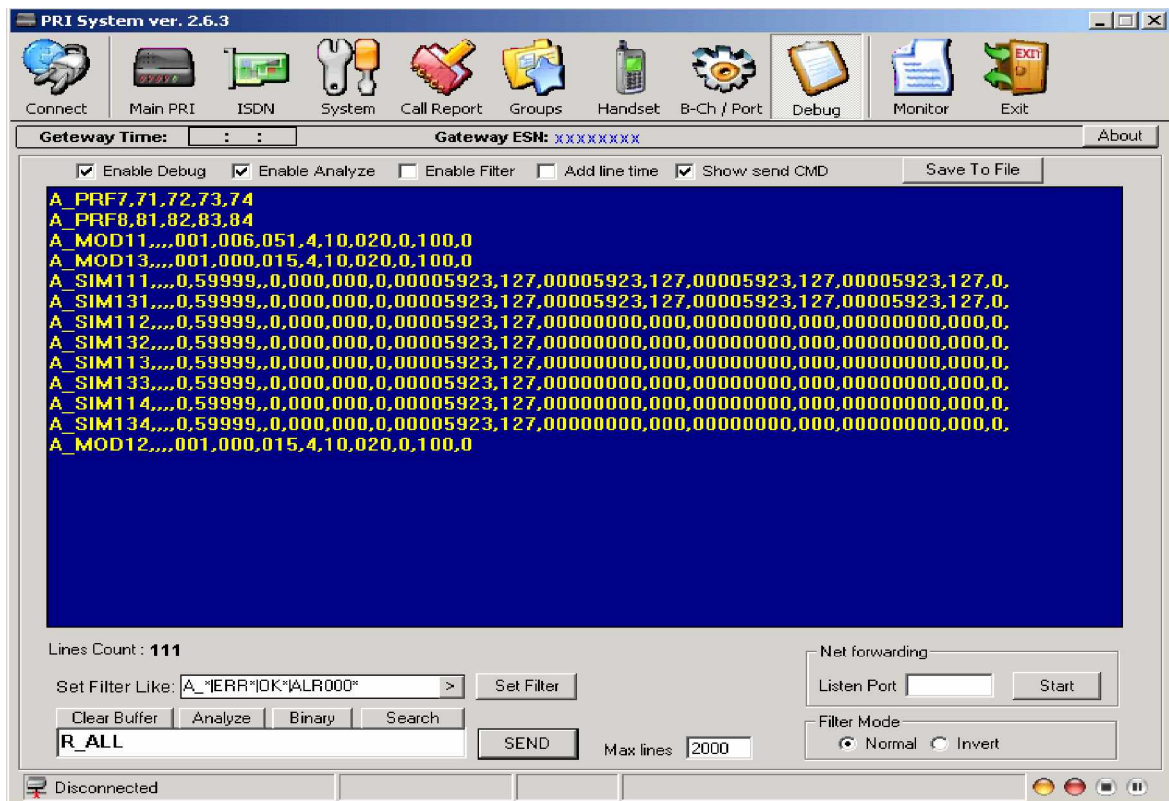

Username :

Password :

Chapter 12.2: The Management Appluaction Debug Window

1. To open the Debug screen, press . The Debug window opens.

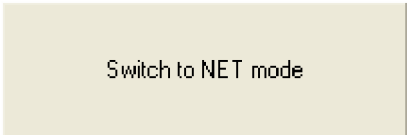

2. Use this only when in contact with a support technician.

There are several common problems and solution we have collected to share with you as follow:

Q.: I'm trying to connect to the MultiCell via LAN, with the PRI Management application, but I keep getting the error message. How to resolve?

A.: Unhook the COM cable from the MultiCell and reboot it. If reboot is unwanted, connect to the MultiCell via COM cable with PRI Management application, go to the System screen and perform actions, described there:

1. Press  . The System window will open.

2. Press .

The system is set for TCP/IP communication between the auxiliary computer and the Multi-Cell unit.

Disconnect from the COM connection and try connecting via LAN again; If the problem persists, contact our support.

Q.: I've made some calls, with the handset, the MultiCell worked perfectly, but now, as I connect the MultiCell to my PBX the calls are not going through. How to resolve?

A.: Check, that you've disabled the test mode, after the calls you've made calls with the handset. When you enter the handset mode, by pressing "Login" the MultiCell goes into the test mode. This means that the communication on the ISDN line is disabled and the only open voice channel is set for the handset.

Q.: Can I use the handset to make calls directly from the Multi-Cell PRI Gateway? For example refill the account of my SIM cards.

A.: It's doable, but be advised, that all of the ongoing calls will be disconnected, the second you login to the handset mode. And all of the incoming calls will be rejected, until you logout from the handset mode.

Q.: I've got too many cables with the MultiCell, which part of I do not know how to use them. Any advise?

A.: There are five connection cables and one power cable, supplied with the Multi-Cell PRI Gateway package:

- RS232/RJ11 cable for connecting the MultiCell to an auxiliary computer (PC).
- Two straight cables, one for the Ethernet LAN connection and the other for the ISDN connection (in case the MultiCell is set to TE Network Access).
- An Ethernet RJ-45 IP cross connect cable for PC to MultiCell connection, direct connection to operate the Management Application using IP connection in a direct PC to MultiCell connection.
- An E1 cross connect cable, is used for ISDN connection, in case the MultiCell is set to NT network access mode.

Q.: I've connected the MultiCell to my VoIP gateway, but calls aren't going through the Gateway. How to resolve?

A.: Check the connection between the VoIP and the MultiCell. The VoIP should be set to Master synchronization and NT network access and the MultiCell should be set to Slave synchronization and TE network access. Note, that the ISDN cable, connecting the MultiCell and VoIP should be straight, not cross. Although check that the calls are sent to the MultiCell from VoIP as "voice", any other setting will result in calls rejection.

Q.: I'm trying to connect to a Gatekeeper with my VoIP Gateway and I cannot pass call through it. How can I resolve this?

A.: This is out of this Manual Scope and we can't help you with since it is VoIP equipment specific. Contact your VoIP equipment support to resolve.

Q.: How can I check if my MultiCell's firmware is up-to-date?

A.: Connect to the MultiCell, using the PRI management application. Go to the "Debug" screen. Check the "Enable Debug" checkbox, uncheck the "Enable filter" checkbox. At the field, near the "SEND" button, enter R_SID11 and press enter. Two rows will be the feedback. At the same field enter R_SYS and press enter. One row of feedback will be shown. Uncheck the "Enable Debug" checkbox. You should get something like the following text message:

```
R_SID11
A_SID11, WAVECOM MODEM, MULTIBAND 900E 1800 .343b09gm 02400A 1368624 062705
13:43.355137000236076,Serial Number 69543004066841111, U: 010605,F: 5FEA17,0002,
R_SYS
A_SYSV3.5-R: 01/11/05- F451B1F,2,0,0
```

The first circled value is the Slave's firmware version the second value is the Master's firmware version.
